

CANDI LAVASTONE

About Candi Lavastone

The word of '**Candi**' for this type of stone is derived from the same source of the basic stone material that founded the Candi Borobudur (famous for Borobudur temple) in Magelang Indonesia.

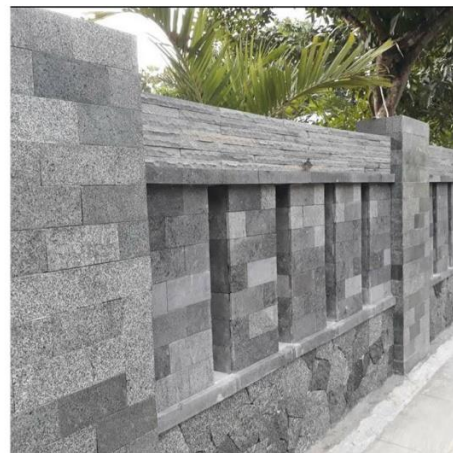

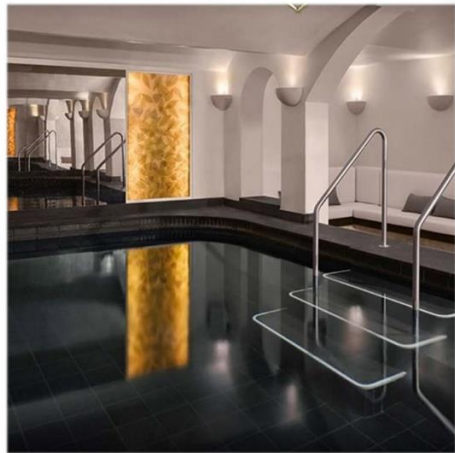

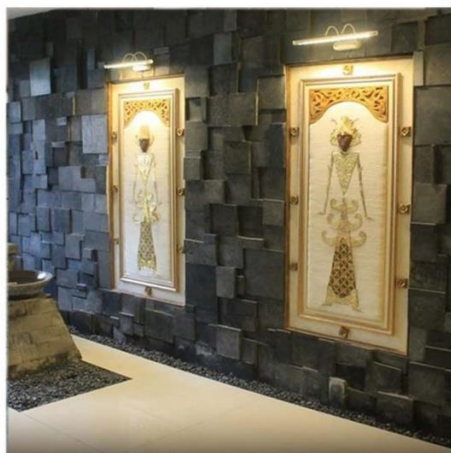

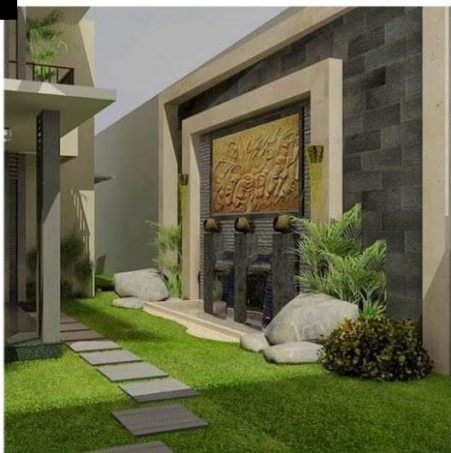

This type of *lavastone* is classified as igneous rocks. This has been formed due to temperature changes from cold lava into frozen rocks.

This is also formed from magma that did not come out to the surface of the earth and slowly hardened and froze.

Density level of this lavarock is very hard, but has a porosity that makes absorb water.

Black is the most color for this stone but some parts of this stone are rather grey also light grey
