

YELLOW PALIMANAN SANDSTONE

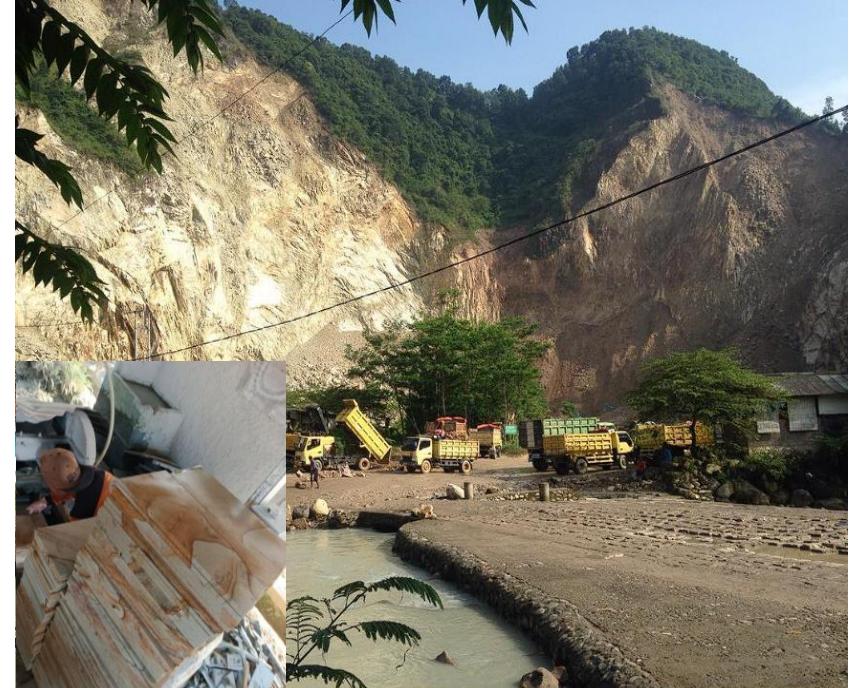

About Yellow Palimanan Sandstone

Palm stone is a sedimentary rock composed mainly of sand-sized minerals or rock grains. Most sandstone is composed of the most common minerals in the Earth's crust.

This sandstone may be in any color, but the most common colors are tan, brown, yellow, red, gray and white.

Since sandstone beds often form highly visible cliffs and other topographic features, certain colors of sandstone have been strongly identified with certain regions.

This stone is one of our main products. The source is very abundant and its location is just a few miles away from our office/factory and originally located in Palimanan, Cirebon - Indonesia
